[Call Smart Buy Knives to order 804-998-7338](tel:804-998-7338)

DESCRIPTION OF GRADES

1- STANDARD INLAID CARBON alloy tool steel, which is manufactured from a composite, inlaid material, utilizing the traditional two piece manufacturing method. The 1/8" thick alloy tool steel, LAID INTO the soft backing material, provides sufficient rigidity and strength to ensure that EBM paper knives will withstand the extreme cutting pressures of high lifts and coated paper.

2- HIGH SPEED STEEL, T1 which is manufactured from the traditional two piece composite knife blanks. Our manufactures HSS inlaid knives contain 18% tungsten (SKH-2) at Rockwell Hardness C 63-65 which is designed to improve blade life as much as five times that of our Standard Inlaid Carbon quality. This alloy combination is designed to be used under high production applications, to ensure an increased number of cuts between sharpening, thereby reducing cost per cutting hour.

3- HIGH SPEED TUNGSTEN STEEL, which is manufactured from single knife blanks. Our DigiKut High Speed Steel Composition is the perfect tool steel combination of Carbon, Chromium, Molybdenum, Vanadium, Cobalt, with Tungsten being its largest component (M35E) at RC 64-67 which is designed to improve the blade life 7 times that of our Standard Inlaid Carbon quality. This "high-tech" alloy combination is designed to be the toughest High Speed Steel used that maintains a long cutting edge under high production applications, to ensure an increased number of cuts between sharpening, thereby reducing cost per cutting hour.

4- INLAID TUNGSTEN CARBIDE TIPPED knife designed to give as much as ten times the blade life between sharpening s, compared to our Standard Inlaid Carbon grade. These precision cutting tools must be used under optimum cutting conditions for the best results.

EBM offers a wide variety of cutting sticks, as shown in the following pages. For any cutting stick requirements that are not specifically listed on the pages following, such as nylon sticks, gray sticks for use with carbide knives, or for makes of equipment or special sizes not shown, please feel free to call our number for more information at 804-998-7338, for pricing.

All of our plastic square cutting sticks are manufactured with holes down the center. All other cutting stick shapes and materials are solid, with no holes.

The method of manufacture for the square cutting sticks with a hole through the center is an improvement which has many benefits, not only to the manufacturer and distributor, but also to the user. The majority of the world's foremost manufacturers who possess the required technological capabilities now adopt this advanced method for square cutting sticks.

The manufacturer finds these advantages:

Speed of production

Reduction of material content

Elimination of porosity in extrudate (a commonplace problem with a solid profile of substantial cube)

More even cooling and stabilizing of material, which reduces any distortion or inherent bend in cutting stick length

Achievement of greater accuracy of size of product, with very low tolerances

The distributor not only benefits from all the advantages listed above, but in addition profits from the improved quality and competitiveness of the product, not to mention from the savings in transport costs due to weight reduction.

The user will in turn benefit from all of the above, and will also experience additional advantages from the hole down the center, such as ease of insertion and extraction from the slot of the machine. The hole also greatly reduces the effects of any swell in the plastic due to extreme pressure from considerable overcutting with a blade, or changes in the temperature.

Finally, there is a small environmental gain in the reduction of the use of plastic.
